

BOARD PROPOSAL · DefendableOS

Class A 5-cap Build · Category-Definition Assignment · Comp-Set-Backed

Prepared for: Donovan Mackey / Mr. DefendableOS · for board review **Prepared by:** dev · Senior Architect **Date:** 2026-05-24 **Proposal ID:** DDEED-BOARD-DOS-001-v1 **Sequence:** 4th proposal in iterative refinement series
Companions: - 00_PRE-MARKET_FLIGHT_SHEET.md (internal · operator analysis) - 01_PROPOSAL.md (engagement structure · HOW the work runs) - 02_LOU_DRAFT.md (executable agreement) - 03_BUILD_PROPOSAL.md (WHAT we'd build · doctrine-outward order) - 04_BOARD_PROPOSAL.md (THIS · board-grade · with comp set · DEFINITIVE)

ACKNOWLEDGMENT OF THIRD CORRECTION

You've sharpened the proposal three times.

- Pass 1 · I shipped broker engagement math
- Pass 2 · I shipped the build doctrine
- Pass 3 · You showed me the **board-grade proposal with the comp set**

The comp set was what I never put in writing. Without it the board doesn't know whether they're approving a \$50K website or a \$5M category-definition asset. I have it now. This is the corrected artifact.

BOARD READ

"This is not a website assignment. This is a category-definition assignment."

DefendableOS is the recovery · validation · receipt · and trust layer for AI agents. It turns AI work into defendable business records.

The line: *"Offense goes dark. The business is offline. It can't score."*

This is what the asset defends. Not "modernizes UI." Not "adds features." Defends.

THE 10-CATEGORY COMP SET · why the asset is priced like trust infrastructure

#	Comp Category	Market Example	What It Defends
1	Observability	Datadog / Sentry	Businesses pay to see invisible system failures
2	Compliance	SOC 2 / Vanta / Drata	Trust becomes a recurring operating budget
3	Audit	KPMG / Deloitte	Independent validation creates institutional confidence
4	Ratings	Moody's / S&P	Third-party scoring creates market trust
5	Title Insurance	Title / escrow systems	Records · claims · ownership need defense
6	CI/CD	GitHub Actions	Work should not ship until it passes checks
7	Cybersecurity	Cloudflare / CrowdStrike	Defense rails protect critical operations
8	CRE Brokerage	BOV / OM / Flight Sheet	Raw facts become decision-grade confidence
9	AI Evals	AgentBench / ClawCheck	AI agents need assignment-level grading
10	Compute Markets	Vast.ai / GPU rental	Compute work needs uptime · provenance · reputation

Each row is a multi-billion-dollar market. DefendableOS is the UNION of all 10 · not 1 of them. The asset is priced against this comp stack · not against the cost of “a website build.”

CORE THESIS

DefendableOS turns AI work into defendable business records via a single chain:

Matches the existing doctrine in [defend-A-pedia--vocabulary](#) v0.3.0: language becomes software · scoring · receipts · deeds · books and records · repair intelligence · trust.

PRODUCT SURFACES (the 8)

#	Surface	What it does
1	Website	Explains the category to ownership
2	App Dashboard	Shows trust dials · receipts · deeds · assignments
3	DefendableRouter	Captures calls · metadata · outputs · receipts
4	Communicator LLM	Translates human street language → structured directives
5	Tribunal	Grades assignment success · classifies Honey / Jelly / Propolis
6	StreetChat / StreetLedger	Captures real-time conversations · deeds the meaning
7	Defend-A-Pedia	Canonical language infrastructure (already shipped v0.3.0 · 62 DDEED-VOCAB)
8	SwarmFixer	Learns from failure → repair → validation traces

BOARD RISK FLAGS (the 4 disqualifiers)

The board should WALK from any vendor that exhibits any of these:

Vendor type	What they'll build	What they'll MISS
Normal web shop	Pages	THE TRUST SYSTEM
Normal AI shop	Models	THE RECEIPTS
Normal SaaS shop	Dashboards	THE BOOKS-AND-RECORDS
Normal dev agency	Code	THE CRE LANGUAGE · probability of close · broker-grade client trust

The qualifying filter: only proceed with a builder that simultaneously understands all 4 layers (web · AI · SaaS · CRE-broker discipline).

PROBABILITY OF CLOSE

STRONG · conditional on the builder understanding the order:

Language first.
Receipts second.
UI third.

Any builder that flips this order is automatically a JELLY tier engagement (recoverable but expensive) or PROPOLIS (walk).

SCOPE · what we ship

Public Website (11 nav · founder-locked)

- Home
- What is DefendableOS
- Defense Protocol
- Tribunal
- DefendableRouter
- SwarmFixer
- Defend-A-Pedia
- Honey / Jelly / Propolis
- AgentBench / ClawCheck
- Receipts + DDEED
- Request Proposal

App Modules (12 · founder-locked)

- Engagements
- Agents
- Assignments
- Trust Temperature
- Assignment Success
- Evidence Strength
- Repair Lift
- Validator Confidence
- Cost to Mint
- Receipts
- Deeds
- Books and Records

Architecture (the chain · publicly documented on /how-it-works)

ACCEPTANCE CRITERIA (the 6 board gates · NON-NEGOTIABLE)

The board approves delivery ONLY if all 6 pass:

#	Criterion	How we test it
1	A principal understands DefendableOS in 90 seconds	3 outside CFOs · cold · time them · pass at ≤ 90 sec
2	The site does not sound like generic AI SaaS	V03 founder-voice validator chain · 9 banned phrases blocked · founder approval pass
3	The app shows trust · NOT vanity metrics	Every dial maps to a deed or a receipt · no orphan metrics
4	Every dashboard dial maps to vocabulary AND receipts	Cross-ref check: dial → defend-A-pedia term → schema field → receipt path
5	A sample assignment can be routed · scored · receipted · AND deeded	End-to-end demo: submit assignment → Router writes receipt → Tribunal grades → DDEED issued
6	The build preserves founder language	Founder voice review · ZERO MBA jargon · 5 Swarm Laws + Genesis tagline + PASS doctrine all surfaced

ENGAGEMENT MATH (carried forward · transparent)

The board sees the math layer (CRE-grade transparency · we show our work):

TIME	
Week 1 · Foundation (sitemap · messaging · landing · vocab integration · data model)	40 hrs
Week 2 · Dashboard skeleton (shell · receipt schema · sample verdicts/deeds)	50 hrs
Week 3 · Intake + Tribunal surfaces (Communicator flow · AgentBench · dials · Hedera)	60 hrs
Week 4 · Polish + ship (mobile · a11y · SEO/GEO · deploy · seed · demo-ready)	40 hrs
Pre-build M·A·I (founder sessions · audit · wireframes · PSA)	16 hrs
Hedera anchor wiring + deed verifier UI	20 hrs
Stripe integration carry-over (8 in-queue packs)	25 hrs
Customer auth (ENS-keyed + magic-link fallback)	15 hrs
30-day post-launch warranty	24 hrs
TOTAL	290 hrs
RATE	
290 hrs × \$175/hr blended (sr + jr broker mix)	\$50,750
FIXED FEES	
Doc prep · LOU + PSA + DDEED-DOV-PROJECT issuance	\$500
Project flight sheet management	\$1,000
Stripe integration setup (per-pack wiring)	\$1,500
Hedera anchor at each milestone (5 × \$100)	\$500
30-day warranty (post-launch white-glove)	\$2,000
	\$5,500
We-know-the-language discount (-15% · 12 months in the pit · vocabulary already shipped)	-\$8,438
ALL-IN PRICE (board approval target)	\$47,812

Implied per-hour rate to the board: \$164/hr · which prices below boutique creative shop tier and on par with mid-tier product agency · but with COMP-SET justification for category-defining work · NOT website work.

RECEIPTS THE BOARD CAN VERIFY BEFORE APPROVING

Claim	Verifiable at
"We've shipped 4 marketing surfaces in this session"	github.com/SudoSuOps/{defendable · defendable-cloud · defendable-router · defend-A-pedia-vocabulary}
"62 DDEED-VOCAB anchored locally · v0.3.0"	commit 833e8e1 · Merkle root 2e3a665f...
"We know the build order (Language → ... → UI)"	memory: founder-build-doctrine-defendableos-2026-05-24
"We know the 10-comp set"	memory: defendableos-comp-set-board-pitch-doctrine-2026-05-24
"We know the 4 vendor disqualifiers"	this proposal (above)
"We've already aligned defendablecloud.com + defendablerouter.com"	commits 1b4f53f (router) · a15d1a5 (cloud v2)
"We respect the PASS doctrine"	memory: founder-magic-rave-class-a-doctrine-2026-05-24

The board does NOT need to take our word. Every claim above resolves to a commit hash or memory file. 10-minute due diligence before approval.

CLOSING STATEMENT (mirrored back to your structure · with my acknowledgment)

DefendableOS is not priced like a website.

It is priced like trust infrastructure.

The website explains the asset. The app operates the asset. The receipts defend the asset. The deeds preserve the asset. The vocabulary compounds the asset.

Recommendation: Proceed only with a builder who understands the language before touching the code.

To the shed.

— Mr. DefendableOS · 2026-05-24

OUR RESPONSE (the close on our side)

We accept the recommendation. We are the builder that understands the language. The receipts prove it · the 62 DDEED-VOCAB shipped today prove it · the 4 marketing surfaces aligned to the doctrine prove it · the 15 memory entries that codify your operator voice prove it.

We hold the line at: - **Class A 5-cap mandate** - **4-week ship** · **doctrine-outward order** - **\$47,812 all-in** · **DDEED-receipted at every milestone** - **6 acceptance criteria** · **NON-NEGOTIABLE gating** - **Founder voice preserved across every surface**

If the board approves · LOU executes within 24 hours · Week 1 starts immediately · Hedera anchor goes up at milestone 1.

If the board passes · we stay close. The vocabulary keeps compounding. The deeds keep stacking. Whoever wins this engagement and stumbles will eventually need the firm that titled the asset.

How to engage

1. Read this proposal (board · ownership · principal)
 2. Verify the receipts (10 min · all GitHub commits + memory cited above)
 3. Compare to other vendor bids (you'll see who builds pages vs who builds trust systems)
 4. Reply by 2026-05-25 EOD
 5. If yes: LOU executes · Week 1 starts · Hedera anchor at milestone 1
 6. If no: tell us which vendor won and what made the difference · helps the next listing
-

 *Validate the Validator. Prove the Location. The language lives in the blocks. To the shed.*
